1. Project idea

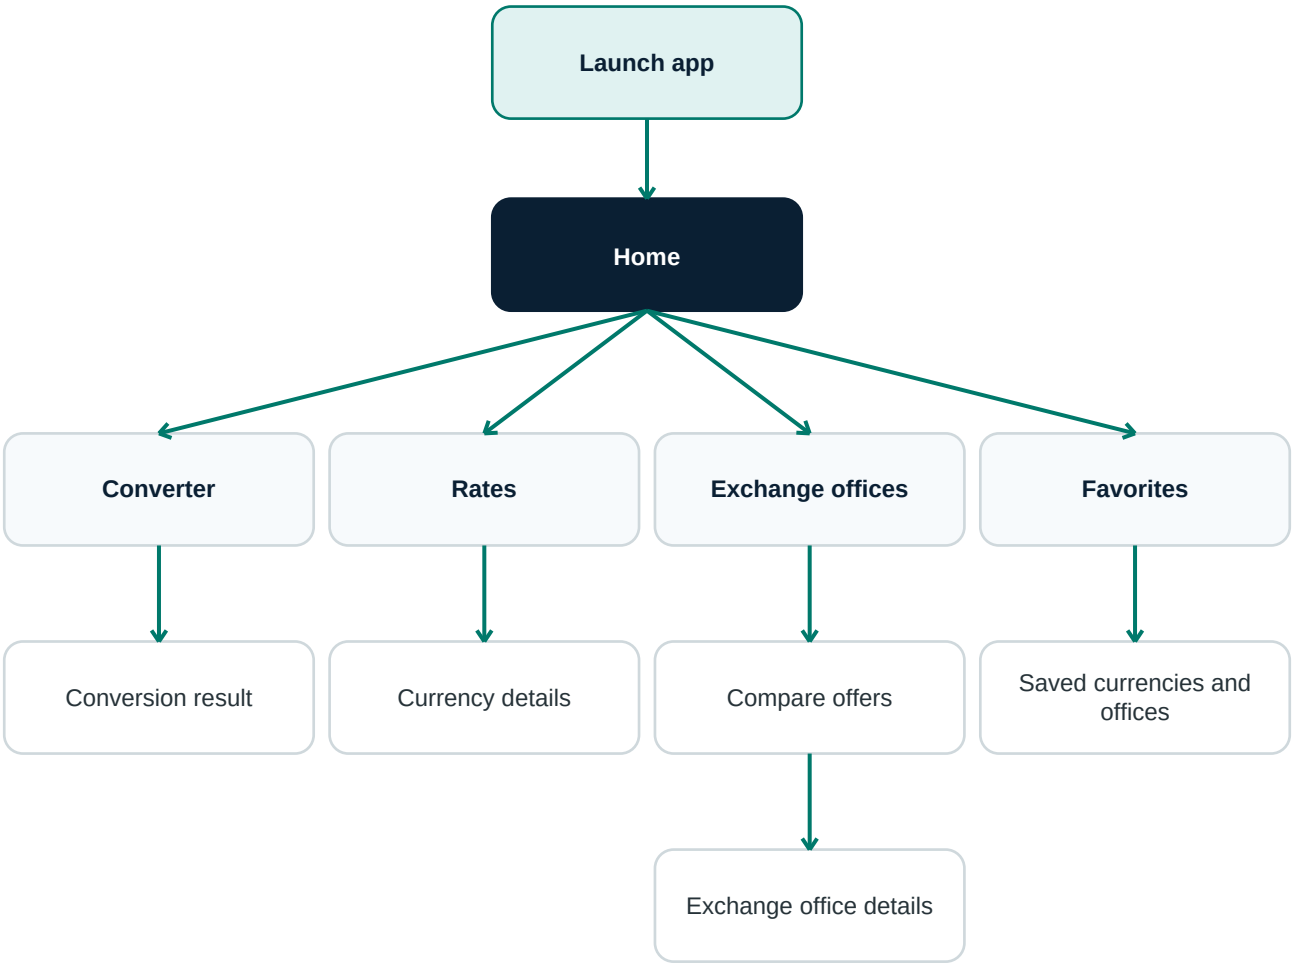
RateRadar KZ is an Android application that helps users track the latest available currency rates and compare buy and sell offers from exchange offices in Kazakhstan. People currently spend time checking several sources and can lose money when they rely on outdated or unfavorable rates, so this is a practical, recurring problem. Users can select a currency pair, enter an amount, compare the resulting offers, and save preferred currencies or exchange offices. The app is designed for travelers, students, freelancers, small-business owners, and anyone who regularly exchanges currency.

2. Functionality list

1. Users can choose a base and target currency from supported ISO currency codes.
2. Users can enter an amount and calculate its converted value using the latest available rate.
3. Users can browse exchange-office offers with buy rates, sell rates, and update times.
4. Users can compare and sort offers by the best rate or resulting transaction amount.
5. Users can filter offers by city, currency, and transaction type (buy or sell).
6. Users can open an exchange-office detail screen with its address, contacts, and working hours.
7. Users can add or remove favorite currencies and exchange offices, with selections retained after restart.
8. Users can refresh data and see clear loading, empty, offline/cached, and error states.

3. Core screen flow

The diagram shows the main navigation only: the start screen, key user actions, and resulting screens.



4. Project setup and submission

Android project	Kotlin, Jetpack Compose, single Empty Activity
Build setup	Gradle wrapper, Android SDK 36, minimum SDK 24
Version control	Git repository on the main branch
Repository	Public GitHub repository with the initial scaffold
Documentation	Root README with features, structure, and run instructions
